The "Publish Show" options
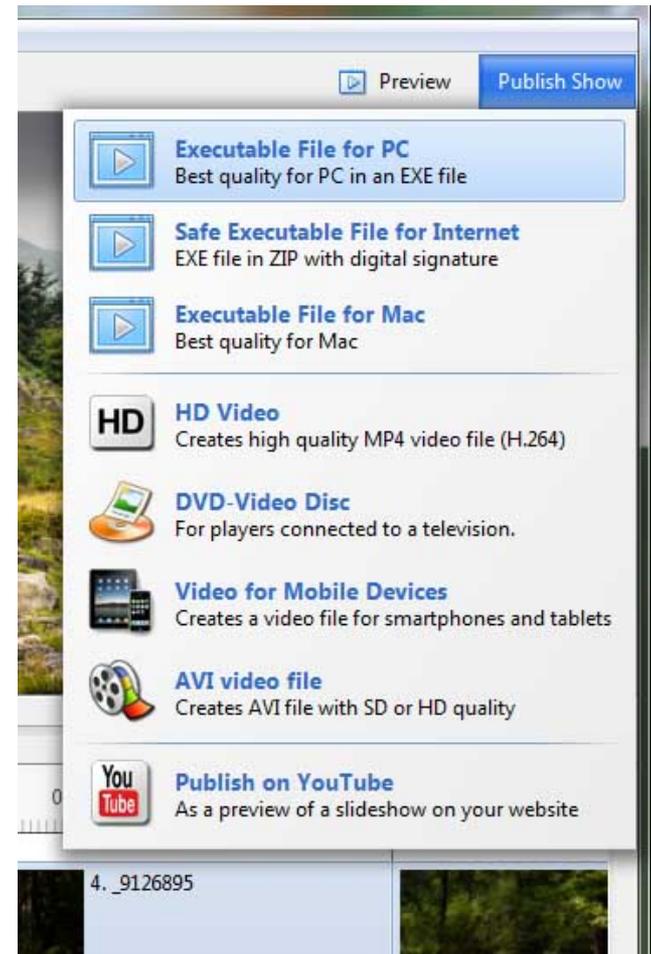

1**. Executable for PC** – this is the primary output from Pictures to Exe. It's on the tin. The executable file can be copied on to a disc, memory card, or more usual and convenient nowadays , a memory stick. Any PC can simply run the executable (.exe) file, which contains all the images, music and transitions. This is normally 4:3 Format. There are no options.

2. **Safe Executable File for Internet**. Makes a zip file of the executable for download. There are no options.

3. **HD Video**. This creates an Mp4 HD video file, also known as .mov file in Apple circles. As it's title suggests, this creates a High Definition show which can be shown on most PC' and Mac.

4. **DVD Video disc**. This option is for playing on a normal DVD player attached to a TV. Quality is not as good as option 1 or 3. Many modern TV's can now play MP4's input via a SD card. This is a better option than DVD video disc if possible
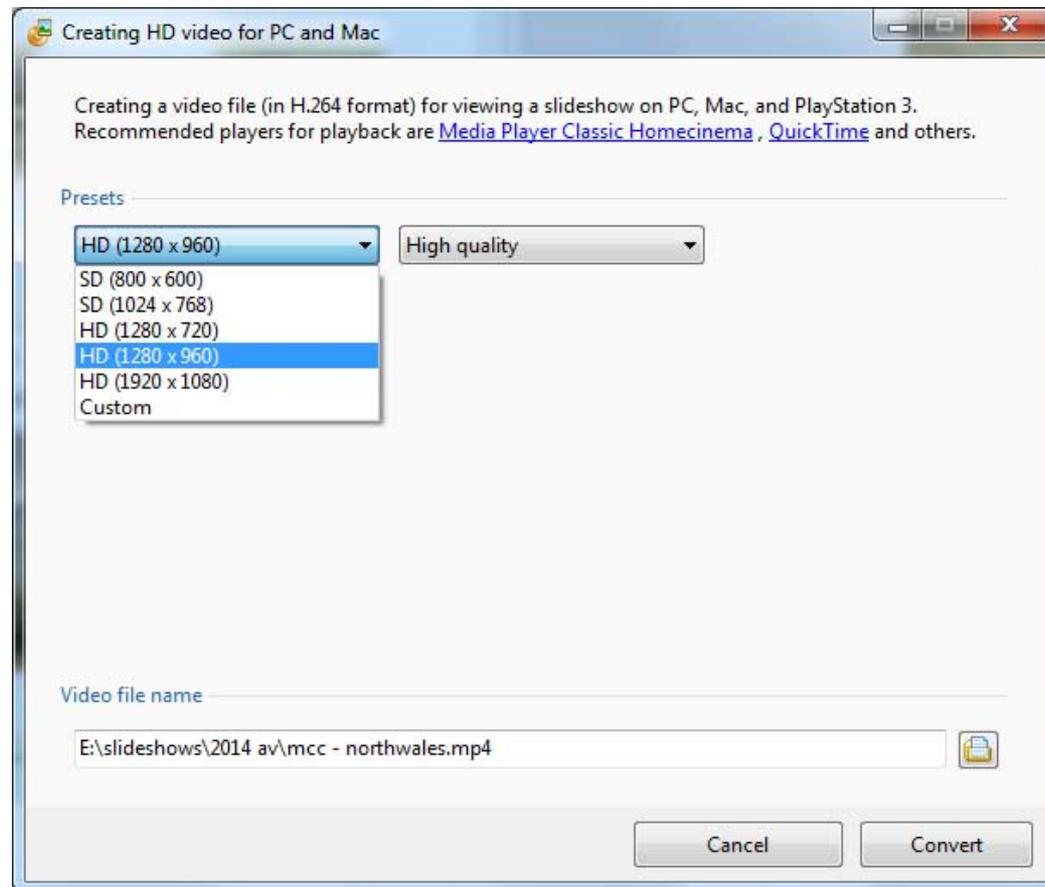

HD Video options(1).
Presets
HD (1920x1080) – this is for wide screen viewing, PC or TV (16:9)
HD (1280 x 960) – this is for digital projection . (4:3)

HD Video options(2).

Pan and Scan enabled. Select Diabled if you don't want the output device to expand your show to fill the screen, which can lead to distortion!

Video File name tells you where the file will be saved and it's name. Check this carefully, you may spend the rest of your life looking for it!

Click **Convert** to begin the process.

And Finally

When you are happy with your slideshow, go to File->Create Backup in ZIP

This will create a zip file with all your images, sound and project file.

This can then be reopened at a later date and worked on.
